

Irish Organic Weed Killer

About Us

In early 2009, Galway father and business man Oisin Concannon, conscious of the dangers of chemicals to children and pets, was looking for a non-toxic weedkiller in his local hardware stores. He discovered that no 100% natural weedkiller existed in the Irish market and set about developing a natural, Irish made alternative to chemical weedkillers.

Following months of research, development and vigorous product testing in OECD accredited laboratories in Europe, Irish Organic Weedkiller was born. Irish Organic Weedkiller is now the only Irish company licensed to manufacture and market organic weedkiller in Ireland and holds licenses to develop 13 organic weed killer products.

How It Works

Our weed killers disrupt the plant cells performance and damage the weed structure causing the cell walls to break down. Weeds die quickly from this basic level of destruction. Irish Organic Weed Killer is a desiccant. That means it removes moisture from the weed. When sprayed on plant foliage, the water in the leaves is drawn out, and the top growth of the plant is killed. The formula is drawn into the weed and down the stem for total destruction. The PH change makes the soil uninhabitable for the root. The strength of the solution of Irish Organic Weed Killer determines how fast it will kill. Persistent weeds may require a second treatment.

Irish Organic Weedkiller products are available in Concentrate and Ready-to-Use formulations in select independent hardware stores throughout Ireland. The product will launch in the UK later this year where it will be stocked by the market leading Vital Earth Garden Centres and Stores.

The product was shortlisted for the Best New Green Product Award at The Irish Green Awards 2010. The Awards are designed to commend eco-friendly products proven to be as effective as non-green traditional products.
